Suicide in Missouri: Where We Stand

  - Suicide is the 9th leading cause of death in Missouri.
  - Suicide is the 2nd leading cause of death among 10-17 year olds. More than 60% of these suicides are firearm related.
  - A large majority (75%) of those who die by suicide are White males. However, the greatest decrease in suicides from 2018-2019 was among Black males.
  - Suicide rates are highest among 25-64 year olds.
  - 60% of all suicides involve firearms, followed by suffocation (24%) and poisoning/overdose (11%).
  - Rural areas in Missouri have slightly higher suicide rates than urban areas.
Suicidal Thoughts and Attempts

- 25% of college students in Missouri had suicidal thoughts in the past year and 2.1% attempted suicide (Missouri Assessment of College Health Behaviors, 2020).

- 9.8% of middle school and 11.9% of high school seriously considered suicide in the past year (Missouri Student Survey, 2020).

Suicides by Age, Race and Sex

- Suicides decreased slightly among all age groups.
- Highest suicide rates were among adults 25-64.
- Youth rates in 2014 were much lower than older age groups; increased in 2016 and 2017 but leveled off in 2019.
- Suicides are consistently higher among Whites.
- Suicides among Blacks increased between 2015 and 2018 but decreased between 2018 and 2019.
- Suicides are consistently higher among males than females. Greater decrease in female suicides in 2019 compared to males.
Suicide rates are highest in the Kansas City and southwest regions of the state and lowest in the St. Louis metropolitan area.

The number of suicides is highest in the St. Louis metropolitan area (342) followed by the Kansas City area (278). Numbers are lowest in northeast and northwest Missouri (39 and 38 respectively).

Suicides by Region
- Rural areas in Missouri have slightly higher suicide rates than metropolitan areas.
- Differences in rural and urban suicide rates are less compared to prior years.

Suicides by Mechanism
- 60% of Missourians who died by suicide in 2019 used a firearm to end their lives.
- Males are more likely to use firearms than females.
- Firearm-related suicides increase with age.
- Overdose/poisoning deaths have decreased by almost 5% since 2015.

## Notes

All 2019 mortality data were obtained from the Missouri Department of Health and Senior Services. These data are provisional and subject to change. Rates were calculated using 2018 population data and were age-adjusted except for graphics including age. WISQARS data were not available for 2019. Data are based on place of decedent residence, not location of suicide.

* Rate is unreliable; numerator less than 20 (MOPHIMS)
** Regions are defined by the Behavioral Risk Factor Surveillance System designations. [https://health.mo.gov/data/pdf/bfrss.pdf](https://health.mo.gov/data/pdf/bfrss.pdf)
*** “Firearms” include pistols, rifles and shotguns. “Other” includes jumping, cutting, drowning and unspecified/other”.
